Novel polynucleotide which down regulates expression of Ets-related gen useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 90; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, Imphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tubercus sclerosis, port-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, osler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG,

```
the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour under conditions suitable for the treatment. Leukaemia or tumour ampiogenesis is treated by administering (1) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (1) is useful for reducing ERG activity in a cell, by contacting the cell with (1). (1) is useful for cleaving RNA of ERG gene, by contacting (1) with RNA, in the presence of a divalent cation such as Mg2+. (1) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnosit cool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (1) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and construction called the invention
under conditions suitable for
contacting cells of the patient with (I)

Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.

Example 2; SEQ ID NO 716; 60pp + Sequence Listing; English.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SL, ABB83999), a sequence having 65% sequence of factity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful of cor identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHLL including diagnosing and treating cancer, they useful in the development of vaccines and (II) is caseful for measuring and for surveying gene expression and creating care useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the privated specification, but is based on sequence information supplied to berwent by the European Patent Office

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           à
                                                                                                                                           The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65% sequence of 730 amino acids (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful as downstream components of the signal transduction pathway. (I) is useful constituting a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating cansed by altered expression of human POSHL1 including diagnosing and treating canser, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomucleotide useful in examples of the invention. Note: The present sequence information supplied to printed specification, but is based on sequence information supplied to

New purified human transmembrane protein, designated as tumor endothelial
                                                                                                                                                                                                                               The present invention relates to a novel method for the isolation of endothelial cells (ECs), and the identification of genes expressed in normal and tumour Ecs. Tumour endothelial marker (TEM), normal endothelial marker (TEM), normal polynucleotiels sequences encoding them are useful for detecting, diagnosing or treating tumours as encoding them are useful for detecting, diagnosing or treating tumours endothelial as polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis, and psoriasis. They are also useful for inhibiting neoangiogenesis or tumour angiogenesis, for inducing an immune response to tumour endothelial cells in a patient, or for identifying candidate drugs for treating tumours. ABX72067-ABX72116 represent human TEM DNA tags
                                    marker (TEM) 3, useful for detecting, diagnosing or treating tumors, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; antisense; inozyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptemer; HBV reverse transcriptase; Enhancer I region; viral replication; degemerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

                                                                                                                                                                                                         The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptemers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Bnhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds
                                                                                                                                                                                                                                                                                                                                                                              that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                   for treating cirrhosis, liver failure, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;

                                                                                                                                                                                                        ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistence. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the the nucleotides, or the complement, or corresponding RNA, of the
                                           New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                    present invention relates to murine oligonucleotides (ACC62754-
                                                                                                                                                                                                                                                                                                                                                                                             specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                            degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, approprist and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis
                                                                                                                                                                                                                                                                                                                                                      and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal

WPI; 2003-513700/48.

Treating and/or preventing e.g. malaria or tuberculosis, or eliciting an immune response, comprises administering a priming composition and a boosting composition containing a non-replicating viral vector in either order.

Claim 8; Page 87; 302pp; English.

The invention relates to a fowlpox virus (FPV) genome which has modifications in one or more wild-type FPV genes. The invention further relates to a novel method for treating and/or preventing a disease in a subject comprising administering two compositions, each containing a non-replicating viral vector. At least one of the compositions comprises a poxvirus vector derived from a fowlpox virus. The novel compositions have

```
antipyretic, cytostatic, hepatorropic, and antibacterial. The non-particularly mammans such as a primate, specifically human. The priming or boosting composition, or the kit is useful for manufacturing a medicament for treating and/or preventing a disease which is, or results from, a chronic infection such as malaria, tuberculosis or East Coast fever, or for eliciting a T-cell immune response in a subject. Non-cultured CEF cells are useful for growing an avipox virus, such as fowlpox virus. The method or the vaccine may further be used to treat or prevent influenza, hepatitis, human papilloma virus and other viral infections, malignancies such as tumours, leishmaniasis, listeriosis, and theileria. This polynucleotide sequence represents the deleted region of the Orfi gene of the fowlpox virus genome of the invention.
      following activities: virucide, tuberculostatic, protozoacide,

Murine and Human interleukin 17D DNA, polypeptides and its fragments, as molecular weight markers. useful 

Example 1; Page 56; 72pp; English.

This encodes a polyhistidine sequence used in the construction of human and mouse interleukin-17D immunoglobulin poly histidine-tagged fusion proteins. The homology between IL-17 and IL-17D suggests that the IL-17D polypeptide is capable of signalling through cytokine receptors. The IL-17D protein and fragments of it are useful as controls for peptide fragmentation which can be used to determine the isoelectric point of a sample protein. Antibodies generated against IL-17D and its fragmented peptides can be used to enhance the accuracy of these molecular weight markers. IL-17D can also be used as a therapeutic agent for the treatment of diseases mediated by IL-17D. IL-17D polypeptides bind to B cells. It is likely that these polypeptides can be used for targeting compounds to B cells and B cell tumours, and for specific selection of B cell populations

                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a PCR primer used to isolate DNA encoding the human Nck associated protein 1 (Napl) of the invention. Napl inhibits apoptosis. The protein can be used in the investigation, diagnosis and treatment (e.g. by gene therapy) of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                   Protein inhibiting apoptosis, useful in the diagnosis and treatment of Alzheimer's disease.

This sequence was derived from the ITS sequences, specifically from the regions of the ITS which exhibit the greatest difference among the fungal pathotypes. This allows the identification of specific pathogens and provides a method for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human biallelic marker downstream amplification primer SEQ ID NO:8157.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ65579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents acting on a disease as well as the characterisation of the differential efficacious responses to and side effects from the SEQ ID Nos 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and a sequence in the Sequence Listing from the
Novel biallelic markers used to construct a high density disequilibrium map of the human genome.

```

The present sequence is an antisense oligonucleotide for the human Galpha-i3 gene. The protein produced from this gene is a member of the Gprotein family, and more specifically of the Gi family. The Gi proteins are involved in hormonal inhibition of adenylyl cyclase and the regulation of plasma membrane enzymes. In addition, Galpha-i3 has been shown to have a role in the dopamine, thyrotropin-releasing hormone and somatostatin signal transduction pathways. The oligonucleotide may be used to modulate expression of the Galpha-i3 gene and can be used to Sequence 18 BP; 1 A; 3 C; 3 G; 11 T; 0 U; 0 Other; prevent infection, inflammation and tumours

This enables the detection, isolation and analysis of nascent proteins using UV without the usual accompanying radioactivity problems. It may be used to detect mutations, for example in cancer, Duchenne muscular dystrophy, adenomatous polyposis coli and colon cancer
Novel antisense compounds useful for inhibiting the expression of human 3-phosphoinositide dependent protein kinase-1, useful e.g. for treating inflammation, tumors and infections.
                                                                                                                                                                                    oligonucleotides containing a central gap region, consisting of ten 2'-deoxynucleotides, which is flanked on both sides by 2'-methoxyethyl (2'-wOE) wings. The oligonucleotides have a phosphorothioate backbone. The antisense oligonucleotides are useful for inhibiting the expression of human PDK-1 in human cells or tissues. They are also useful for preventing or delaying infection, inflammation or tumours and are useful
                                                                                                              The present sequence is one of a large number of antisense oligonucleotides which are targeted to a nucleic acid molecule encoding human 3-phosphoinositide dependent protein kinase-1 (PDK-1). The antisense compounds may be oligodeoxynucleotides or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method for detecting nascent proteins by fluorescence comprises misaminoacylating a tRNA molecule with a marker compound, useful for detecting mutations in proteins, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein detection; protein analysis; aminoacylated tRNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of treating osteoarthritis via the administration of a composition comprising the camptodactyly-arthropathy-caxa vara-pericarditis (GACP) protein, or portions of the CACP protein. The composition may further comprise a local anaesthetic. The composition of the invention may be administered via intra-articular or intravenous injection. The human CACP protein is identified in the invention as being megakaryocyte stimulating factor (MSF). The gene encoding CACP protein (MSF) is located on chromosome 1q25-31, and mutations in this gene are responsible for the heritable disorder camptodactyly-arthropathy-coxa vara-pericarditis, in which patients have synovial hyperplasia without evidence of inflammation. CACP protein (MSF) acts as a synovium lubricant, and can be used to lubricate tissue and joints in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 treatment of osteoarthritis. The composition may be applied to reduce the symptoms of osteoarthritis (e.g., joint pain, loss of range of movement or joint damage). Sequences AAFS9672-AAFS9693 represent PCR primers used to amplify exonic gene fragments from GACP genomic DNA or to amplify cDNA fragments for the detection of mutations

Human genotyping PCR primer #4.

```
The present invention relates to a fused gene containing DNAs encoding a secretory signal peptide, a protein capable of capturing a metal and a protein localised on the cell surface. The gene can be used to express the metal capturing protein, which can then be used in purifying and recovering metal, for example in waste treatment. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fused gene with DNA expressing polypeptide capable of capturing metal, for recombinant vectors and transformants applicable in purifying environment and recovering metal efficiently, including waste treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4.4%; Score 12.8; DB 1; Length 18; 87.5%; Pred. The invention relates to an isolated mucially and a numbal gene encoding aminopeptidase to an isolated mucially and a fundaminopeptidase to an isolated mucially and processor in the invention receptor B1 (TACR1), C1 esterase inhibitor (CINH), kallikrein 1 (ACE2) or protease inhibitor 4 (F14), comprising at least one can comprising at least one of polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single mucleotide polymorphisms comprising additional 5, and 3' flanking genomic sequence; (2) analysing (M1) at least one nucleic acid sample comprising controlled and etermining the nucleic acid sequence at one or more polymorphic positions in a gene of comprising grouping at least two nucleic acid sequence at one or more polymorphic positions in a gene comprising grouping at least two nucleic acids encoding a protein selected from the group above; (3) constructing (M2) haplotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder upon administration of an ACE inhibitor and/or vasopeptidase inhibitor using the polymorphic data; (5) a library of nucleic acids, eacth of which comprising obtaining a nucleic acids sample, determining the comprising obtaining a nucleic acids sample, determining the comprising obtaining a nucleic acid sample, treating, and compositions are useful for detecting, disaposing, treating, and compositions are useful for detecting, disaposing, treating, involve angiogenesis like haemangiomas, tumours, sarcomas, crohn's disease, trachomas, and cardiovascular diseases like angine protoris, chypertension, heart failure, myocacdial infarction, ventricular chypertension, heart failure, myocacdial infarction, ventricular chypertension, artery disease, arteriosclerosis andoing a useful New isolated nucleic acid with at least one polymorphic position, usfor detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and The invention relates to an isolated nucleic acid from a human gene Example 3; Page 889; 977pp; English. autoimmune diseases.

The polymorphic has hepatotropic and antilipaemic activity. The polymorphic variants are useful in studying the expression and function of CYP7A1, in expressing CYP7A1 protein for use in screening candidate drugs to treat diseases related to CYP7A1 use in studying the effect of the variation on the biological activity of CYP7A1, and the binding affinity of candidate drugs targeting CYP7A1 for the treatment of disorders such as cholesterol and bile disorders. Haplotyping methods are useful in validating CYP7A1 as a
                  diseases and disorders are listed in the specification). The polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is a genotyping PCR primer for the gene encoding one of the proteins listed above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     candidate target for treating a specific condition or disease predicted to be associated with CYPA1 activity, or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with CYPA1 activity, such as cirrhosis, familial hypertriglyceridaemia and hypercholesterolaemia. Transgenic animals are also useful for studying expression of the CYPA1 isogenes in vivo, for in vivo screening and testing of drugs targeted against CYPA1 protein, and for testing the efficacy of therapeutic agents and compounds related to cholesterol and bile acid metabolism. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, CYP7A1; hepatotropic; antilipaemic; cholesterol disorder;

and lifestyle related disorders, comprising a substance that prevents expression or function of a polypeptide having a 300 or 345 residue amino acid sequence, given in the specification. The invention further relates to a nucleic acid comprising a 1038 or 1324 nucleotide sequence, given in the specification. The novel remedies have anabolic activity and can be used to treat disorders by gene therapy or cell therapy. The remedies can be used in the treatment of anorexia and lifestyle related disorders such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention relates to novel remedies for the treatment for anorexia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel assay for determining the ability of a test compound to modulate the formation of a trimolecular complex (TC) including interleukin (IL), a soluble IL-receptor (IL-R) polypeptide and a soluble IL-R accessory protein (IL-RACP). The method comprises bringing into contact an IL polypeptide, a soluble IL-R polypeptide, a soluble IL-R polypeptide and a test compound, and determining the amount of TC formed. The method of the invention is useful for determining the ability of a test compound to modulate the formation of a trimolecular complex including IL, a soluble IL-R and a soluble IL-RACP. The method is useful for high throughput screening and enables direct measurement of protein binding characteristics. It is also useful for identifying small molecule inhibitors of TC and hence of IL-1 biological activity. The method may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining ability of test compound to modulate formation of interleukin soluble trimolecular complex, by bringing into contact the components of the complex and test compound and determining amount of complex formed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         used in screening methods and assays for agents which modulate the interaction between IL and IL-R, and/or the interaction between IL-RACP and the interaction between IL-RACP and the IL-R/IL biomolecular complexes. This method identifies small molecule inhibitors of TC and hence IL-1 biological activity, and provides a significant advantage over prior methods since it is possible to dose orally and to reduce the cost of production of such compounds compared to the production cost of recombinant proteins. The main advantage of using soluble forms of the proteins in the method is the ease with which these reagents enable the formatting and running of High
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Throughput Screening (HTS) assays. The present sequence represents a DNA sequence encoding an interleukin 1 family protein used in the method of

                                                                                                                                                                                                                                                                                                                                                                       0;
                                                                                                                                                                                      Primer 3 and 4 (AAQ86978-79) were used to amplify a 467 bp nucleotide sequence (AAQ86977) from S. aureus capable of hybridising with the DNA or RNA of methicillin resistant S. aureus (MRSA). The probe is specifically derived from the mecA gene of S. aureus and S. epidermidis. The mecA gene product has no homology with Known PBPs (penicillin-binding proteins). The new probes allow for the rapid identification of all MRS, eradicating need for labour intensive in vitro cultivation and physiological assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAT30546-T30558 represent probes for the J chains of an antibody produced by the hybridoma cell HNK-20. AAT30555-T30558 represent probes for the Jheavy chain of the HNK-20 antibody. HNK-20 is a murine hybridoma cell line, that produces IgA specific for the F glycoprotein of respiratory syncytial virus (RSV). The variable chain coding sequences (see AAT30456-

T30458) were isolated using primers specific for the 5' untranslated region of the variable region, and for the intron downstream of the rearranged J region (see AAT30459-T30545). The amplified sequences can be inserted into vectors containing heterologous (such as human) constant region genes, for the production of chimeric and isotype-switched antibodies. The antibodies are useful in the treatment and diagnosis of infection by RSV, such as pneumonia and bronchiolitis, in humans and animals. By using genomic DNA as a template, variable region genes can be isolated without producing fragments that have to be adapted for recombinant antibody expression. Also, by using the genomic DNA, no knowledge of the DNA sequence encoding the target variable region is required. Chimeric antibodies produced from the encoded proteins, that contain the constant region of the host being treated, are less likely to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   detect the lacz gene which had been injected into C57B1/6 mice using a recombinant adeno-associated virus (AAV) vector. This confirmed the adeno-associated virus vector can be used to deliver a therapeutic molecule to the liver of a mammal. This can be used for the expression of therapeutic molecules such as secretory proteins, antisense molecules or ribozymes, in the liver, especially to treat hepatic diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            lacz; adeno-associated virus vector; therapeutic; liver; hepatic disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polymucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelespecific amplification assay for determining the identity of a nucleotide at a FG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigat (PSA) dosage. However, the effectiveness of this is limited due to its inhibitive of discriminate between malignant and non-malignant affections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of a prostate cancer associated gene and biallelic markers derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease
                                                                                Gaps

The specification describes a method for detecting mycobacteria, especially for differentiating, in diagnostic terms, an immunisation resulting from BCG vaccination or an infection by M. tuberculosis. The method comprises detection of polymuclectide sequences that are deleted from the genome of Mycobacterium bovis but present in the genome of M. tuberculosis, or vice versa. The polymuclectide sequences that are deleted are the following genes or open reading frames (ORFS): Rv2346c, Rv2347c, Rv2348c, plcC, plcB, plcA, Rv2352c, Rv2352c, Rv3425, Rv3426, Rv3427c, Rv3428c, plcC, plcB, plcA, Rv255c, Rv255c, Rv3425, Rv346c, Rv3427c, Rv3512c, Rv3620c, Rv3641c, Rv1965, mce3, Rv1967c, Rv1977, ephA, Rv2075, cehAl, Rv023c, Rv3621c, Rv3622c, lpdG, cobL, Rv2073c, Rv2074, Rv2075c, echAl, Rv023c, Rv3621c, Rv362c, lpdG, cobL, Rv2073c, Rv2074, Rv2075c, echAl, Rv023c, Rv3621c, Rv362c, lpdG, cobL, Rv2073c, Rv2074, Rv2075c, echAl, Rv023c, Rv204c, Rv01-ORF1, Rv01-ORF2, plcD, Rv02-ORF1, Rv02-ORF1, Rv02-ORF2, gequence sallows discrimination between mycobacteria. The present sequence represents a PCR primer which is used to in the method of the invention, to identify the deleted polynucleotide sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Autoimmune thyroid disease; interleukin; promoter; IL-4; polymorphism; autoimmune hypothyroidism; Grave's disease; PCR-haplotyping; genotyping;
                                                                                                                                                                                                                                                                                                                                            Novel VRNI polynucleotide sequence encoding a polypeptide which alters vernalization response of plant in which VRNI nucleic acid is expressed, useful for influencing and assessing vernalization phenotype of plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of Arabidopsis thaliana VRNI. This protein is capable of altering the vernalisation responses of a plant. Also provided are a number of PCR primers used to isolate the sequences. The sequences are useful in the production of crop plants, where they are able to control the timing of flowering, the duration of vernalisation required, the optimum temperature, or even eliminate the need for vernalisation completely. The

                                                                                                                                                                                                                                                                                                                                                                                                                              predisposition to autoimmune thyroid disease or establishing any genetic basis for autoimmune thyroid disease, the symptoms of which are manifested in a human subject. The method involves determining the genotype of the subject at the -590 position of promoter region of the IL-4 gene or at one or more polymorphic loci in linkage disequilibrium with the IL-4 -590 c/t polymorphism. The method is useful for determining a predisposition to autoimmune thyroid disease such as autoimmune hypothyroidism or grave's disease in a human subject. Sequences AAH22924-935 represent allele-specific primers for various interleukin (IL-1) sequences, used for PCR-haplotyping in the genotyping methodology of the
Screening human subject for predisposition to autoimmune thyroid disease such as autoimmune hypothyroidism/Grave's disease, by determining genotype of subject at specified position of promoter region of IL-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Screening an individual for increased risk of low folate status, comprises detecting mutation in human glutamate carboxypeptidase II gene which affects ability of hydrolyzing terminal glutamates from dietary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, glutamate carboxypeptidase II, GCDII gene, dietary folate, FGCP, folypoly-gamma-glutamate carboxypeptidase, hyperhomocyteinaemia, cardiovascular disease, Alzheimer's disease, neural tube defect, congenital heart defect, colon cancer, PCR primer, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

```

The patent discloses methods for screening an individual for increased risk of low folate status. The method involves detecting a mutation in the human bylatamate carboxypeptidase (GFD) II gene in a biological sample from said individual, wherein detection of the mutation is indicative of decreased ability of an individual to hydrolyse terminal glutamate residues from dietary folates by folypoly-gamma-glutamate carboxypeptidase (FGCP), a product of GFDII gene. The decreased ability is associated with low folate status. The method is useful for screening an individual for increased risk of low folate status and conditions associated with hyperhomocyteinaemia, cardiovascular disease, colon cancer and altered cognition in the elderly including Alzheimer's disease. Pregnant women with low folate status are at increased risk of bearing children with neural tube defects and congenital heart defects. The present DNA sequence is a PCR primer which is used for amplifying exon-11 of GCPII gene. This primer is designed from PSMA genomic sequence and is used for detecting a mutation in GCPII gene

Arraying genome clones.

Claim 4; Page 28; 528pp; Japanese.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the marker is changed so that the same discrimination Nos. succeed to the marker markimum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal 

resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals are detected from the amplified broducts; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent For primers for human chromosome 1956-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention the mixed clones are cultured and the 4.4%; Score 12.8; DB 1; Length 19; 87.5%; Pred. Identifying cleavage sites of a target RNA, by adding target RNA to library of nucleic acids e.g. ribozyme, which comprise catalytic core flanked by random nucleotides and isolating nucleic acid that cleave target RNA

Example 1; Page 31; 79pp; English.

The present invention relates to a method of identifying cleavage sites in a target RNA which are accessible to a ribozyme comprising a catalytic core flamked by random nucleotides. A target RNA is added to the library of nucleic and nucleic acids that bind to and/or cleave the target RNA are isolated. The method is useful for identifying ribozyme cleavage sites in sequences and in real time PCR assays. The present sequence is random library sequence used in the exemplification of the invention

to a nucleic acid encoding human or mouse tumour necrosis factor receptor 2 (TNFR2). Also described is a method for inhibiting expression of human or mouse TNFR2 comprising contacting cells or tissues in vitro with one of the claimed compounds. The antisense compounds are used to treat a disease or condition associated with expression of TNFR2. The present sequence represents a PCR probe for human TNFR2, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes compounds of 8-30 nucleobases antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New compounds antisense to nucleic acid encoding human or mouse tumor necrosis factor receptor 2 are useful to treat disease associated with mouse tumor necrosis factor receptor 2 expression.

The present invention describes human ATP-binding cassette transporters (ABC). Specifically described are the human ABCAS, ABCA6, ABCA9 and ABCA10. Specifically described are the human ABCAS, ABCA6, ABCA9 and ABCA10 qenes (See ARM89594 to ABM895915 represent ABCA5, ABCA6, Described to ABR89715 represent ABCA5, ABCA6, ABCA9 and ABCA10 genes which are used in the exemplification of the present invention. The ABC sequences have carrianteriosclerotic activities and can be used in gene therapy. ABC sequences can be used in the manufacture of a medicament intended for the prevention and/or treatment of a subject affected by a dysfunction in the reverse transport of cholesterol. The ABC proteins are involved in the reverse transport of cholesterol, in membrane transport of lipophilic molecules, in particular inflammation medicating substance such as prostaglandins and prostacyclins, or in any pathology whose candidate conformation in the prostaglandins and prostacyclins, or in any pathology whose candidate conformation and prostacyclins or in any pathology whose candidate conformation and prostacyclins or in any pathology whose candidate conformation and prostacyclins or in any pathology whose candidate conformation and prostacyclins or in any pathology whose candidate conformation and prostacyclins or in any pathology whose candidate conformation of a medicament intended for prevention of arteriosclerosis in various forms. The ABCA5, ABCA6, ABCA9 and ABCA10 constant intended for prevention of genes are located to chromosome 17, more specifically to the 17924 locus

A novel nucleic acid corresponding to ATP-binding cassette transporter genes and the encoded polypeptide, useful for preventing or treating a dysfunction in reverse transport of cholesterol.

```
The invention relates to amplifying a whole genome which involves exposing cells to alkaline conditions to form a cell lysate comprising a whole genome, reducing the pH of the cell lysate to form a stabilized cell lysate, and incubating the stabilized cell lysate under conditions that promote replication of the genome, where replication of the genome results in replicated strands. The methods and compositions of the present invention are useful for the exponential amplification of noticing cites, including genotyping of single nucleotide polymorphisms (SNPs), chromosome painting, Southern blotting and restirction fragment length polymorphism (RtPLP) analysis, subcloning and DNA sequencing. Sequences ACC48031-040 represent sequence-specific right primers used for PCR amplification of the human c-Jun gene
                                                                                                                                                                                                            Amplification of nucleic acid sequences by displacing replicated strands from the target sequence, useful in genotyping of single nucleotide polymorphisms, chromosome painting, Southern blotting, subcloning and DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lasken R3, Fang L, Faruqi AF, Alsmadi OA, Driscoll MD;

The invention relates to a method of amplifying whole genome. The method is useful for amplifying a whole genome, for identification of bacterial strains by amplification of microbial DNA, for obtaining enough DNA from unculturable organisms for sequencing or other studies, for amplification of degraded genomic DNA and amplification of forensic material for restriction fragment length polymorphism (RFLP)-based testing. The present sequence represents a primer specific for human c-jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is from the exon of the Valpha7 gene of the T cell receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Diagnosis of auto:immune disease and antibodies for disease treatment
by detecting RFLP encoding variable region of T-cell antigen receptor
                                                                                                                                                                                                                                                                                           Gaps

This sequence represents a probe for hepatitis b virus (HBV), used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polymucleic acids (I) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample with at least I suitable primer pair; (b) hybridising (I) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid support and hybridise specifically to mutant target sequences chosen from the HBV RT pol gene region, HBV precore region, HBAB region and/or HBV genotype specific target sequences, or their complements or U for T homologues; (c) detecting the hybrids formed in step (b), and inferring the HBV genotype and/or mutants present in the sample from the differential hybridistation signal(s). The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, specifically genotype, precore mutations, vaccine escape
and contains a polymorphism (tag a). The nucleotide at position 10 is normally a "G". The polymorhic gene was identified when PCR prods. from several unrelated individuals were electro- phoresed through a denaturing gradient gel. The gel discriminates DNA sequence differences on the basis of altered melting properties of allelic forms of the same gene. They can also be detected by Southern blot/RFLP procedures. Presence of the polymorphism may indicate a predisposition to disease. See also AAQ12609-Q12623. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Probe; hepatitis b virus; HBV detection; RT pol region; genetic analysis; preCore region; HBsAg region; genotype specific target; mutation detection; ss.

The identified genes or fragments of these genes can be used for identifying genes and gene products that are intimately related to malignant transformation or maintenance of the malignant properties of cancer cells. It can also be used to design or screen diagnostic reagents or therapeutic compounds. Kits are included within the scope of the invention

                                                                                                                                                                                                                                                                                                                                  phosphoenolpyruvate carboxylase. The storage lipid content of a seed is increased by reducing the activity of endogenous cytosolic pyruvate kinase in the seed. This is applied to plants which accumulate storage protein and lipid in the embryo, particularly an oilseed plant such as soya, sunflower, sesame or especially rapessed. Inhibitory enzymes involved in amino acid biosynthesis increases production of lipid by directing more of the precursor to the chloroplast

16S rRNA gene primers rRNAfor (AAT62499) and rRNArev (AAT62500) were used as internal positive controls in PCR techniques to amplify Bacillus thuringiensis toxin genes using cryV-specific primers (see also AAT62493-97). The 16S rRNA gene primers yield a PCR-amplified fragment of 182 bp corresponding to nucleotides 1188-1370 in the sequence. This size is smaller than fragments expected from any of the cryV-specific primer
                                                                                                                                                                                                                                                           New Bacillus thuringiensis isolates - polynucleotide sequences encoding toxins useful for controlling nematode and coleopteran pests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.

AAX09121-X1026B are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Addrich syndrome, Pabry's disease, familial hypercholesterolemia, polycystic kidney disease, harditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary camerorytagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases

Detection of chromosomal abnormalities - by subjecting patient nucleic acids to a multiplex molecular amplification procedure primers specific for characteristic nucleic acid sequence.

Claim 73; Page 79; 126pp; English

This sequence represents a primer used in the method of the invention for the detection of the presence or absence of chromosomal abnormalities, each abnormality being associated with a condition in a subject and each being defined by at least one characteristic nucleic acid sequence. The method comprises: (a) obtaining a sample of nucleic acids derived from a

subject which may harbour one of the chromosomal abnormalities; (b)
subjecting the sample to a multiplex molecular amplification (MMA)

procedure, where a number of the characteristic sequences, if present in
a sufficient amount, will be amplified; (c) retrieving the product(s)
from step (b), and detecting the presence and/or absence of an amplicon
characteristic of the abnormal sequences to detect the presence or
absence of corresponding chromosomal abnormalities; where the MMA

procedure comprises the use of at least 7 mutually distinct primers (MDP)
in one single reaction mixture, each of the primers defining an end of at
cal least one characteristic nucleic acid sequence, and where at least one of
the primers defines the first end of at least two characteristic nucleic
acid sequences, the characteristic nucleic acid sequences each being
determined in their opposite ends by MDP selected from the remainder of
the MDP. The methods can be used for detecting chromosomal abnormalities ó; carcinoma's, adenocarcinoma's, sarcoma's, glioma's, neuroblastoma's, medullablastoma, malignant melanoma, and malignant neoplastic conditions Gaps lymphoma's, .; 0 4.3%; Score 12.6; DB 1; Length 19; 78.9%; Pred. Human hRAD54 DNA and polypeptide - and agonists, antibodies, antagonists,

Example; Page 23; 64pp; English.

The present sequence represents a PCR primer used in the example from the present invention. The method of the invention is for determining the genetic predisposition to cancer in an individual by detecting hRADS4 mutations in a sample. hRADS4 is a queen thought to be present in tumours that display allelic imbalance at Ip32, the chromosomal band identified as one of four minimal regions of chromosome 1 deletion in breast

carcinomas. hRAD54 is useful for production of proteins, inter alia, that have been identified as novel hRAD54 by homology between the amino acid sequence given in AAW62186 and known amino acid sequences such as yeast RAD54. hRAD54 proteins are used in the treatment of cancer, including mental retardation with alpha-thalassaemia syndrome and breast cancer. hRAD54 polynucleotides are also useful for detecting complementary nucleotides for use as a diagnostic agent, especially useful for diagnosis of disease or susceptibility to diseases. hRAD54 polynucleotide, proteins, agonists and antagonists which are proteins are useful in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            primer AAA11091 (see AAV4559) for the PCR amplification of novel mouse prostatic acid phosphatase (PAP) cDNA from mouse prostate. The primers are based on partial mouse PAP clones obtained by 5' and 3'RACE (see AAV45593-98). The isolated full-length cDNA includes a 1158 bp coding region (see AAV45592) encoding a 385-amino acid polypeptide (see AAW30574). PAP cDNA can be used in the recombinant production of mouse PAP. A method for producing an immune response against an autologous polypeptide tumour antigen (e.g. human PAP) involves immunising a subject with a xenogeneic antigen (e.g. mouse PAP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   to induce an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the nucleotide sequence of primer AAA31093, which was used with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAX34376-X34391 as probes for the detection of mutant BRCA1 and BRCA2 genes. The probes are immobilised on a membrane and labelled target mucleotide sequences, which hybridise to the probes, are detected after a single hybridization step. The method and allele-specific oligonucleotides are used to detect gene mutations that predispose individuals to breast and ovarian cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pNEUGO; neuronal-specific 7 transmembrane protein; human; therapy; AMD; age-related macular degeneration; ophthalmological; screening; diagnosis;

                                                                                                                                                                                                                                                                                                                       mutational analysis of human neuronal-specific 7 transmembrane DNA, by MDEUGO. The major site of pNEUGO expression is the sensory neuroretina. Mutations of this gene is associated with the etiology of age-related macular degeneration (AMD). This sequence has ophthalmological activity. The pNEUGO polypeptides and polymoleotides are used for screening, diagnosis and therapy of macular degeneration. The DNA sequences are useful for detection of pNEUGO mutation carriers, prenatal pNEUGO screening and diagnosis of AMD, and in gene therapy

                                                            The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and CYClin B1.
Representative examples of ribozyme recognition sites are given in AAA88415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme in resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin B1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;
                                                                                                                                                                                                                                                                                                                       which bind to the CXC used to treat e.g. cancers and
                                                                                                                                                                                                                                                                                                                                                                          pCR primers AAF85361-62 were used to amplify DNA encoding a human Bonzo polypeptide. Bonzo is a CXC chemokine receptor. The specification describes a method for identifying agents (especially antibodies) which bind to Bonzo and inhibit the binding of a ligand (especially SExCkine) and the agents per se. The agents identified may be used for the treatment of a disorder/disease related to aberrant Bonzo expression and activity, such as inflammatory disease, cancers and/or infections (e.g.

decoxympusine synthase (DHS; see AARTS1051 and AAB66875). The senescence-induced DHS coding sequence, when introduced into a plant cell in reverse orientation, inhibits expression of the endogenous senescence-induced DHS gene, and/or reduces or prevents activation of eIF-5A. DHS is useful for altering age-related senescence and/or environmental stress-related senescence, for inhibiting seed aging and for increasing seed yield in a plant. In addition, the inhibition of senescence in a plant results in increased resistance of the plant to environmental stress-induced and/or pathogen-induced senescence, increased plant biomass, delayed fruit softening and spoilage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tomato, Arabidopsis and carnation cDNA clones encoding senescence-induced deoxyhypusine synthase and eIF-5a, useful for inhibiting senescence in a plant when introduced in reverse orientation into the genome of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, inflammatory bowel disease 1 protein; IBD1; IBD1prox; intestinal inflammatory disease; apoptosis; NF-Kappa B; cancer; inflammatory disease; immune disease; cryptogenetic inflammation; hemorrhagic rectocolitis; Crohn's disease; Blau syndrome; PCR primer; ss.

Primers AA165647-78 were used to characterise biallelic polymorphic markers in the IBD1 gene region. The IBD1 gene encodes an inflammatory bowel disease 1 (IBD1) polypeptide, which is associated with intestinal inflammatory disease. The specification also describes a polypeptide which is in proximity to IBD1, and is designated IBD1prox. The IBD1 gene is probably involved in regulation of geophosis and activation of NF-ckappa B. The IBD1 and IBD1prox polymucleotides are is useful as source of probes and primers, as source of (anti) sense oligonucleotides, for recombinant production of polypeptides, and in screening for interactive compounds. The polypeptides are used to raise specific antibodies which useful for diagnostic detection or purification of IBD1 and IBD1prox polymucleotides and polypeptides are useful for screen for specific binding agents, potential therapeutic agents. The IBD1 and IBD1prox polymucleotides and polypeptides are useful for treatment and prevention of inflammatory and/or immune diseases or cancer, where associated with mutations in genes corresponding to IBD1 and IBD1prox, especially cryptogenetic inflammation of the intestines (hemorrhagic rectocolitis, Crohn's disease and Blau syndrome)
                                                                                                                                                                                                                               New human nucleic acids associated with intestinal inflammatory diskuseful for diagnosis, prognosis and control of these diseases, also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 19 BP; 1 A; 6 C; 6 G; 6 T; 0 U; 0 Other;

Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.

Example 1; Page 100; 408pp; English.

inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipooriatic, dermatological, cytostatic, antisteborrheic, antidiabetic, antistickling, cophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retining and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn and the sequences used in the The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteriase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and wirucide activities, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing cararing such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AMHS7577 to AAH62099 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                    Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HIV-1 related binding molecule oligonucleotide sequence SEQ ID NO:146.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                            The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the eample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosaing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL89321 represent
                                               essentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
Collection of binding groups for determining or typing samples, especially clinical samples, has groups capable to identify ess all members of the family of nucleic acids of relatively high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .;

Unidiatorida polymorphisms comprising additional 5. and 3. Lianking genomic comparisons comprising obtaining the sample from one or more individuals and determining the nucleic acid sample from one or more individuals and determining the nucleic acid sequence at one or more polymorphic positions in a gene encoding a protein selected from the group above; (3) constructing (M2) haplotypes using the genes comprising grouping at least two nucleic acids (c) (4) identifying (M3) an individual at risk of developing a disorder upon administration of an ACE inhibitor and/or vasopeptidase inhibitor upon administration of an ACE inhibitor and/or vasopeptidase inhibitor comprises one or more polymorphic positions within a gene encoding a individual comprising obtaining a nucleic acid sample, determining the individual comprising obtaining a nucleic acid sample, determining the comprises one or more polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, convexing the various disorders such as angloedeam and diseases which involve anglogenesis like haemangionas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, thypertrophy, vascular diseases, and cardiovascular diseases, inflammatory arteriosclerosis and/or atherosclerosis, and comparing or convexing antiment of seases inflammatory conversed or such the function of three or convexing the convexing th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   encoding aminopeptidase P (KPNEP2), bradykinin receptor B1 (BDKRB1), tachykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein [KLKI], bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme 2 (ACE2) or protease inhibitor 4 (P14), comprising at least one polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5, and 3' flanking genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence represents or contains the region surrounding a single- nucleotide polymorphism in one of the genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The

(SENE-) SENESCO TECHNOLOGIES INC.

Lu DL; Thompson JE, Wang T, WPI; 2002-557545/59. Increasing resistance to physiological disease in plant, by integrating gene or its fragment encoding senescence-induced deoxyhypusine synthase or eIF5A in antisense orientation into plant genome and growing the plant

Example 6; Page 42; 114pp; English.

The invention relates to increasing resistance to physiological disease in a plant, involving integrating into the plant genome a vector having attisences esquences complementary to corresponding portion of one strand of bulls are sequences complementary to corresponding portion of one strand of DNA encoding endogenous senescence-induced of DNA encoding endogenous senescence-induced corresponding portion of RNA sequence encoded by eIP-5A gene or DHS gene, and growing the plant. Also included is a plant or its progeny, where the plant is derived from a cell having inhibited or reduced expression of senescence-induced DHS, senescence induced eIF-5A, or both, where the cell is produced by the method of the invention. The method is useful for increasing resistance to physiological disease such as blossom end rot in a plant. The method results in delayed onset of as blossom end rot in a plant. The method results in delayed onset of correct on a plant shelf-life and/or growth period. The method delays deterioration and spoilage of perishable fruits, flowers, vegetables, and plants, increases the shelf-life of perishable fruits, flowers, regetables, and plants, and renders their tissues more stress-clowed to isolate a partial Arabidopsis deoxyhypusine synthase cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) a clones of the genomic libraries contained in multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the marker is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. cored to alscrimination Nos. are maxed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones and the reconstituted as the positions on the chromosome and arrayed. The clones are increased for human chromosome 219521, which are ABL45323 to ABL45334 to 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; LL-5; LCAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; translocation; chronic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atheroselerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial ischaemia; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;

```
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNF-alpha mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as for treatment of AIDS. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              b DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method has been developed for killing or inhibiting the growth of bacteria by contacting the bacteria with a peptide nucleic acid (PNA). The PNA is targeted to messenger or ribosomal RNA. The antibacterial composition has bacteriostatic and bactericidal properties. The PNA can be used to treat a mammal suffering from a bacterial infection where the PNA is complementary to a region of ribosomal RNA and of mRNA of the bacteria. Further treatment may include concurrent treatment with an antibiotic. The PNA can also be used as a method of disinfection by solution) and rimining the object with a sterile liquid to remove the PNA. The invention provides new ways of tackling bacterial infections which have become resistant to frequently used antibiotics. The present sequence represents a PNA from an example of the present invention
                                                                                                                                                                                                                                                                                                                                                                   /*tag= c /note= "t is attached to an amidated lysine residue e.g. -t-Lys-NH2"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Killing or inhibiting bacterial growth by using a peptide nucleic acid.

CHMR1 is one subtype of a family of 5 genetically distinct muscarinic acetylcholine receptors, mAChB, that play important roles in higher brain function such as learning and memory. The protein is a possible drug target for treatments for Alzheimer's disease and antibodies raised against the protein are useful for diagnosing and developing treatments for diseases associated with the abnormal expression of the gene or activity of the protein, e.g. Alzheimer's disease and dementia with Lewy bodies
                                                                                                                                                                                                                                                                                                                                                                            New variants of the ml muscarinic acetylcholine receptor gene, useful to find treatment for Alzheimer's and dementia, have single nucleotide variations at one or more of five polymorphic sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents an egl linked peptide nucleic acid (PNA), which is used in the method of the invention. The specification describes a method for determining target gene function in bacteria. The method comprises providing a nucleotide sequence of the target gene from the bacteria, selecting and preparing PNAs with regions complementary to a part of the nucleotide sequence, in anti-parallel orientation, determining activity of PNA by selected assay to identify active PNA compounds, contacting the bacteria and the active PNA compounds, contacting the bacteria. The method is useful for determining effect of these on the bacteria. The method is useful for useful in the design of antisense antibacterial drugs and gene function analysis in bacteria. The method is used for killing or inhibiting of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining bacterial target gene function, involves preparing peptide nucleic acid (PNA) compounds complementary to bacterial nucleotide sequence, determining activity of PNA, contacting active PNA compounds and determining the effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bacterial growth inhibitor; bacterial infection; disinfectant; PNA; antibacterial; peptide nucleic acid; ss.

The patent discloses methods and compositions for killing or inhibiting growth of bacteria comprising contacting the bacteria with a peptide nucleic acid (PRA) complementary to a region of the bacterial inbosomal RNA. The method is used to treat a bacterial infection in a mammal and as a disinfectant. The present sequence is an egl linked peptide nucleic acid (PNA) which is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Killing or inhibiting growth of bacteria using peptide nucleic acids complementary to a region of the bacterial ribosomal RNA is useful to treat a bacterial infection in a mammal and as a disinfectant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.

AAX09121-X10268 are allele-specific oligonuclectide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary con spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary can be aemorrhadic telanguectasia, familial colonic polyposis, Bhlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such system, infection by pathogenic microorganisms, and characteristics such can longwity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid control of such diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease.

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DB line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, correct PI field.)

Regions of the mRNA hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. Regions of the mRNA that do not form secondary folding structures and that contain potential computer analysis. Ribozymes cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid architis, asthma and other inflammatory disorders. An oligomer has been developed which is capable of inhibiting expression of an interleukin gene. The interleukin gene is preferably an interleukin of an interleukin gene. The oligomer can be an oligomucleotide or an oligomucleotide analogue. When it is an oligomucleotide analogue it is coligomucleotide analogue. When it is an oligomucleotide analogue it is selected from protein mucleic acid, morpholino, methylene linkage, boronated, and pteridine oligomucleotide analogues. The analogue is consorted at its 5' end on 3' end to an intercalator. The intercalator is a linked at its 5' end on 3' end to an intercalator. The intercalator is a coligomucleotide made of DNA. The oligomucleotide is a phosphodiester oligomucleotide derivative, respecially a phosphodiester oligomucleotide derivative, especially a phosphodiester oligomucleotide of the present septents a specifically claimed to collgomucleotide of the present invention. The oligomer can be used to alleviate inflammatory polyarthopathy, especially that associated with crewmatoid arthritis. The oligomer can also be used to alleviate colligomer can also be used to alleviate of the present and also be used to alleviate inflammation, especially that associated with chronic asthma
                                                                                                                                                         Oligomer capable of inhibiting expression of an interleukin gene - is used to alleviate inflammatory poly-arthopathy, especially rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    transcription-inhibiting complex; polypurine-polypyrimidine region; inflammatory poly-arthopathy; rheumatoid arthritis; asthma; ss.

```
An oligomer has been developed which is capable of inhibiting expression of an interleukin gene. The interleukin gene is preferably an interleukin cof an interleukin gene. The oligomer can be an oligomucleotide or an interleukin coligomucleotide analogue. When it is an oligomucleotide analogue it is selected from protein nucleic acid, morpholino, methylene linkage, coronated, and pteridine oligomucleotide analogue is linked at its 5' end or 3' end to an intercalator. The analogue is long psoralen or acridine derivative. The oligomucleotide is a phosphodiester, coligomucleotide derivative. The oligomucleotide is a phosphodiester oligomucleotide derivative, especially a phosphodiester oligomucleotide derivative, especially a phosphodiester oligomucleotide is at least 5 (preferably 5-50) nucleotides, in length. The present sequence represents a specifically claimed oligomucleotide of the present invention. The oligomer can be used to alleviate inflammatory polyarthopathy, especially that associated with rheumatoid arthritis. The oligomer can also be used to alleviate the present can also be used to alleviate interpretations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      eosinophilic inflammation, especially that associated with chronic asthma

Pavco PA,

integrin subunit alpha-6, or integrin subunit beta-3 

gene, an integrin alpha Subunit Gara, as integrin albaliate beta spans, as integrin alpha Subunit Gara, as integrin alpha Subunit Gara, or the 2 gene. AAA16775 to and AAA1761 to AAA1762 represent ribozyme sequences for ARNIT, corresponding target sequences, AAA1868 to AAA18385 and AAA19987 to corresponding target sequences, AAA1868 to AAA18385 and AAA19987 to AAA19155 to AAA1922 represent their corresponding target sequences, and AAA1922 to AAA1923 to AAA21501 to AAA21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA21362 to AAA21500 and AAA21595 to AAA21550 and AAA21368 represent their corresponding target sequences, AAA21596 to AAA21595 to AAA23323 to AAA23343 to AAA22475 and AAA223405 to AAA23343 to AAA23343 to AAA23363 to AAA23362 to AAA23343 to AAA2342 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNY, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, disbetic retinopathy, age related macular degeneration (ARM), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tubercus sclerosis, pooriasis, verruca vulgaris, syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNY, Tie-2, Novel ribozymes for modulating the synthesis, expression and/or stability molecules with RNA The present invention describes enzymatic nucleic acid molecules with RN cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 of an mRNA encoding an angiogenic factors. Claim 54; Page 233; 305pp; English. cleaving

```
capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SDB), comprising in systems where modulation has occurred and/or determining the sequence of at least part of the SDBs in such systems. Nucleic acid molecules with conductease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and inflection. They may also be used to detect genetic drift and wutations in diseased cells and to determine craf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of craf. Introduction of sugar/phosphate modifications intereases stability against nuclease and activity. AAV99922 to AAV93877 represent NACs that can be used in the
                                                                                                                                                                                                                                                                                                                                                        Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               activity. ```
capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endounclease activity and catalytic activity, from the present invention. The are used to modulate gene expression in plant and mammalian cells and to capable to acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased calls and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restencesis, psoriasis or rheumatoid arthritis, or generally any conditional sociated with the level of c-raf. Introduction of sugar/phosphate modifications increased should a cativity adainst nuclease and cativity. Any09022 to Any031877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; single nucleotide polymorphism; SNP; genotyping; DNA analysis; allele specific ollogonucleotide; ASO; reduced complexity genome; RCG; genomic classification; identification; by fingerprinting; tumour characterisation; hybridisation; ss.

A michael and beam coverations to a descent of a descent of a descent of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to
                                                                                                                                                                                                                                                                                    Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs.
                                                                                                                                                                                                                                                                                                                                                                                      A method has been developed for detecting the presence or absence of a

with a target sequence and contain at least one phosphoro(di)thioate
link, having endonuclease activity. (A), and more generally any catalytic
link, having endonuclease activity. (A), and more generally any catalytic
contolic acid (A) that modulates expression of the oestrogen receptor.
Contolic acid (A) that modulates expression of the oestrogen receptor.
General care used to treat cancer (particularly of breast or endometrium),
contolic acid (A) that modulates expression of implanting treated cells, or
for other conditions associated with levels of oestrogen receptor.
Because of the high selectivity for targeted RNA, (A) can also be used to
correlate inhibition of gene expression with alterations in phenotype,
controlarly for identification of therapeutic targets, and as research
controlarly for identification of therapeutic targets, and as research
controlarly for identification of modifications in (A) improves
consequence to nucleases, binding affinity and/or activity. AAA23633 to
AAA24748 to AAA2593 represent their corresponding target
consequences, and AAA26105 represent their corresponding target
sequences, and AAA26107 to AAA26211 represent their corresponding target
consequences AAA26219 to AAA26211 represent their corresponding target
consequences AAA26219 to AAA26211 represent their ribozyme
consequences and

```
with a target sequence and contain at least one phosphoro(di)thioate
lik, having endonuclease activity. (A), and more generally any catalytic
link, having endonuclease activity. (A), and more generally any catalytic
mucleic acid (A) that modulates expression of the oestrogen receptor
converse acid (A) that modulates expression of the oestrogen receptor
correlate incomplication cells ex vivo and implanting treated cells, or
correlate inhibition of gene expression with alterations in phenotype,
correlate inhibition of gene expression with alterations in phenotype,
correlate inhibition of gene expression with alterations in phenotype,
correlate inhibition of gene expression with alterations in phenotype,
correlate inhibition of gene expression with alterations in phenotype,
correlate inhibition of gene expression with alterations in phenotype,
correlates inhibition of gene expression with alterations in phenotype,
correlates inhibition of gene expression with alterations in phenotype,
correlates inhibition of gene expression with alterations in phenotype,
correlates inhibition of gene expression with alterations in phenotype,
correlate inhibition of gene expression with alterations in phenotype,
correlates (for RNA, in the same way that restriction endonucleases are
cused with DNA). The combination of modifications in (A) improves
correlate inhibition of expression receptor haltiputy. AAA23633 to
AAA24747 represent oestrogen receptor haltiput in in and AAA26107 to AAA26210 represent their corresponding target
sequences, and AAA26107 to AAA26211 represent their corresponding target
correlates and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                             New nucleic acids that interact, and optionally cleave, target sequences,

Sequencing primer PFCS13 is 1 of 14 primers (see AAA89007-A89020) customised for the sequencing of chorismate synthase (CS) cDNA (see AAA88980) of Plasmodium falciparum. Components of plant-like metabolic pathways in P. falciparum, such as shikimate pathway CS, can be used to develop compositions that interfere with its growth and survival. Components include enzymes, transit peptides, and nucleotide sequences encoding the enzymes and peptides, or promoters of these sequences, which antibodies, antisense molecules and other inhibitors are directed biagnostic and therapeutic reagents and vaccines are developed based on the components and their inhibitors. CS nucleic acids may be altered to

The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention
Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.

The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels including cancer. The present sequence is an oligonucleotide described in
                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (S1, ABB83999) a sequence having 65% sequence of 6711, (CS1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPsses as well as downstream components of the signal transduction pathway. (I) is useful of identifying a specific binding partner. (I) and mucleic acids (II) for identifying a specific binding partner. (I) and mucleic acids (II) caused by altered expression of human POSHL1 including disease and treating caused by altered expression of human POSHL1 including disease and (II) is useful for measuring and for surveying gene expression and creating cransgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomorbeotide useful in examples of princed specification, but is based on sequence information supplied to browner by the Buropean Patent Office
                                                                                                                                                                Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene;

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (S1, MBB3939), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful cor intentifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and creating causer, they useful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and creating causer. Lin gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating cransgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the harmone we the present sequence is based on sequence information supplied to harmone the present page.
                                                                                                                                                                             Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inoko H, Kagiya T, Ichihara T, Matsumura Y, Moriya S, Nishida M;

                                                                                                                                                                                          The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleorides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primars for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of between them, providing genetic information of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                             Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 327; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement

```
of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the rector or antibodies discerted against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzhaimer's disease and contained and antibodies and/or prognosis of these diseases. The polypeptides can also be useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression or related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                    ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gencitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection; ss.

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 41; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor cand as (IV) is an inozyme, fallowe, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patatent having a condition associated with the level of REL-A. (C I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, corrical, head and neck, ovarian cancer, melanoma, lymphoma, glicoma or cervical, head and neck, ovarian cancer, melanoma, lymphoma, glicoma or cervical, head and neck, ovarian cancer, melanoma, lymphoma, glicoma or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, gementable or radiation therapy. The enzymatic and misense nucleic acid molecules are also useful for treating inflammatory disease such as recensive and molecules are also useful for treating inflammatory disease such as rejection, gene therapy applications, isoher solvesity, autoimmune disease, lupus, multiple solvenis, transplant/graft rejection, gene therapy applications, isohematory bowel disease or rejection. This sennence represents the substrate of a novel enzymatic sequence represents the substrate of a novel enzymatic nucleic acid molecule

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases. WPI; 2003-340953/32.

Claim 3; Page 36; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor. CC regulates B (NEKB), where (I) is an inozyme, g-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2Z+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, cc antisense nucleic acid molecules are useful for treating breast, lung, cc antisense nucleic acid molecules. REL-A specific inhibitors or multidrug resistant cancer. The method involves use of other drug cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therpaps including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouxacil carboplatin, edarrexate, cyclophosphamide, doxorubin, fluorouxacil carboplatin, edarrexate, cyclophosphamide, so useful for treating inflammatory disease such as acid molecules are also useful for treating inflammatory disease such as rhumartorid arrhuring restrance. rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (MCSM/)
```

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies

and transfected cells.

```
The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaccuticals for prevention and/or treatment of viral diseases that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss;

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleotides in vitro sense and antisense sequences, of nucleotides involved in tumour consense and antisense sequences, of nucleotides involved in tumour consuppression or reversion, apoptosis and or viral resistance, to produce experimental models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or call degeneration (e.g. Alzheimer's disease or schizophrenia).
                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page 129; 771pp; French.

Tuijnder M;

New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

Disclosure; Page 425; 771pp; French.

fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, dentifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour complement polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and complemental models. The nucleotides (also vectors containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours and/or prognosis of these diseases. The nucleotides can be used for diagnosis also be used to screen for their specific interactive molecules, expression of the nucleotides and polypeptides can be used to screen for their specific interactive molecules. expression of the nucleotides.

```
AAV51705-V52008 are reverse PCR primers used to amplify fragments of the Zea mays genome in order to detect polymorphic markers. Such markers can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method has been developed of defining a set of compounds that modulate
                                                                                                                                           Brassica species allele-specific oligonucleotide probes and primers useful for plant breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human RhoC phosphorothioate antisense oligonucleotide SEQ ID NO:154
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying compounds which modulate expression of nucleic acids, provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                à
                                                                                                                                                                                                                                                                                                                                         The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the concleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, cleentifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour compensation or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, the nucleotide can be used for the nucleotides and polypeptides can be used to screen for their specific interactive molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymorphic marker; allele-specific; probe; amplification; PCR primer; hybridisation; plant; hybrid certification; genetic contribution; progeny; back-cross; hybrid; ancestry; corn; ss.

Compounds with the LNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of defining a set of oligonucleotides (ONS) that modulate the expression of defining a set of oligonucleotides (ONS) that modulate the expression of comparating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and (2) a method of defining a set of the compounds that modulate the expression of a method of defining of the compounds with the tNA. The methods can be used for the generation of the compounds with the tNA. The methods can be used for the generation chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAX52701 to AAX54701 the expression of a target nucleic acid (tNA) sequence via binding of the

Miniribozyme compounds useful for cleaving a target mRNA in a host cell, e.g. for treating AIDS, arthritis, atherosclerosis, restenosis, bacterial and prokaryotic infection. The specification describes miniribozyme compounds. The minirobozymes, Example; Fig 4; 81pp; English.

oligonuclectide transfer vectors containing a nucleotide sequence encoding the miniribozyme, are useful for cleaving a target mRNA in a

restenosis, psoriasis, cerrical preneplasia, papilloma disease, bacterial and prokaryotic infection, neoplastic conditions associated with production of aberrant RNAs such as in chronic myeloid leukemia. The minitabozymes may be combined with pharmaceutically or veterinarally acceptable carriers or may be supplemented in a composition with one or more anti-viral, anti-fungal, anti-bacterial, anti-parasitic, and protozoan or anthelminthic agents, herbicides or pesticides. AAA56685-ASB61 represent sequences of the N18 domain of miniribozymes of the host cell. They are especially used for treating viral diseases caused by herpes simplex virus or AIDS and other inflammatory diseases such as arthritis and circulatory disorders such as atherosclerosis and 8

New antisense compounds targeting nucleic acids encoding human Akt-3 useful for treating a disease or condition associated with Akt-3 expression, or in preventing or delaying inflammation or tumor formation.

Claim 1; Col 40; 37pp; English.

The present sequence is one of a number of antisense compounds of up to 30 nucleobases in length targeted to a nucleic acid encoding human Akt-3. The antisense compounds are useful for inhibiting the expression of human Akt-3 in human cells or tissues. They are also useful for modulating the expression of Akt-3, and for treating a human or an animal suspected of having, or being prone to, a disease or condition associated with Akt-3 expression. The antisense compounds may also be used as research reagents, in kits and in diagnostics, e.g. to elucidate the function of a particular gene or to distinguish between functions of various members of a biological pathway; and as a prophylactic, e.g. to prevent or delay Infection, inflammation or tumour formation

```
This invention relates to an antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding proteins, where the artisense compound inhibits the expression of the member of the human Rho family. The invention includes antisense oligonucleotides AAF94580 - AAF94680 - AAF94681 which target a RhoA nucleotide sequence, AAF94645 - AAF94684 which target a RhoC nucleotide sequence, AAF94750 which target RhoG nucleotide sequence, AAF94760 which target RhoG nucleotide sequence, AAF94769 - AAF94790 which target a Rac 1 nucleotide sequence and AAF94795 - AAF94699 which target

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cdc42 mucleotide sequence. The antisense compound is useful for treating hyperproliferative conditions, especially cancer, abnormal wound healing or clotting conditions and ischaemia/reperfusion or reoxygenation injury.
                                                                                                                                                                                                                                                                                                                                     Rho; GTP binding protein; phosphorothioate antisense oligonucleotide; RhoA; RhoB; RhoC; RhoG; Rac 1; cdc42; hyperproliferative condition; cancer; wound healing; clotting; ischaemia; reperfusion; reoxygenation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 An antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding proteins useful for

The invention relates to mouse p97 protein, mp97 (a scialoglycoprotein)

and its corresponding cDNA molecule. Mouse p97 protein and its DNA
and its corresponding cDNA molecule. Mouse p97 protein and its DNA
cc ancievale are useful for identifying compounds that affects mp97 protein

activity or expression. The invention are useful for treating neurological
conditions, such as cancer, neurodegenerative diseases (e.g., Alzheimer's

cd iseases. Parkinson's disease, Huntington's disease), demyelinating

diseases, parkinson's disease, Huntington's disease), demyelinating

cd iseases, muritional polyneuropathy, psychosis, pain and

conductions, multiple sclerosis), amyotrophic lateral sclerosis,

bacterial and viral infections, deficiency disease. Mouse p97 DNA's

conclusional disorders, especially Alzheimer's disease. Mouse p97 DNA's

conclusional disorders and antisense oligonucleotides, the preparation

conclusional systems to study mp97, and in diagnostic and therapeutic

capplications. Transgenic p97 mice is useful for identifying essential

The invention relates to a set of novel map-related biallelic markers, chromosoms 3, 10 and 19. The markers are useful for genotyping or estimating the frequency of an allele in a population, for detecting an association between a genotype or haplotype and a phenotype, e.g. a disease involving drug responses, obesity or disorders related to obesity, such as hyperturicaemia, digestive pathology, hepatic function disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia, insulin disorders, atheromatous disease and cardiac insufficiency. The markers are useful for detecting a statistical correlation between a biallelic marker haplotype and/or between a biallelic marker haplotype and a phenotype. This sequence represents a PCR primer used to
                                                                                                                                                                                                                                    Set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19, useful, for e.g. detecting statistical correlations between marker allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; obesity associated-biallelic marker; chromosome 10; obesity; ss; drug response; hyperuricaemia; digestive pathology; hypertension; cancer; hepatic function disorder; cardiovascular disease; hyperlipidaemia; PCR; insulin disorder; atheromatous disease; cardiac insufficiency; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for determining whether an individual is likely to be susceptible to malignant melanoma, and determining the genetic basis for the melanoma in an individual. The method involves screening the genome of the individual for the presence or absence of or or more polymorphic variants of the XRCC3 gene. Sequences AAH47421-423 represent PCR primers used in a genotyping assay of a candidate DNA repair gene ERCC1 (at position 19007 in exon 4)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining the susceptibility of an individual to malignant melanoma, involves screening the genome of the individual for the presence or absence of one or more polymorphic variants of the XRCC3 gene.
                                                                                                                                                                                    XRCC3; XPF; melanoma; genotyping; DNA repair gene; ERCC1; PCR primer;

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. care mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones are constituted as the positions on the chromosome and arrayed. The crones are mirrayed from the detected result; and (i) the clones are pecositiuted as the positions on the chromosome and arrayed. The cromes are present PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 18 BP; 4 A; 6 C; 5 G; 3 T; 0 U; 0 Other;

Determining a predisposition for or the occurrence of neurodegenerative disease, e.g. Alzheimer's disease by detecting in a target nucleic acid the presence or absence of an allelic variant of one or more polymorphic regions

Example 2; Page 267; 848pp; English.

The present invention relates to a method (M1) for determining a predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from uPA (Urokinase plasminogen activator), SNGG (gamma-synuclein), IDB (insulindegrading enzyme), ENSL1 (Kinesin-like protein 1), LIPA (lysosomal acid lypase), and TNFRSFG (Tumour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more presence of at least one of the allelic variant of one or more cocurrence of neurodegenerative disease. The genes are all located on chromosome 10. M1 is useful for determining a predisposition for or the chromosome 10. M1 is useful for determining a predisposition for or the chromosome 10. M1 is useful for determining a predisposition for or the chromosome 10. M1 is useful for determining a predisposition for or the chromosome 10. M1 is useful for determining a predisposition for or the chromosome 10. M1 is useful for determining a predisposition for or the chromosome 10. M1 is useful for determining a predisposition for or the chromosome 10. M1 is useful for determining a predisposition for or the chromosome 10. M1 is useful for general induced in a port predisposition for or the chromosome 10. M1 is useful for general induced in a predisposition for or the chromosome 10. M1 is useful for general induced in a predisposition for or the interminant of the invention.

Sequencing complex genomes, present as fragments in a cosmid library - by sequencing end-specific nuclectides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes.

Example 4; Page 72; 128pp; English.

Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning. A sample of 371

```
field.)

and DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer" program available from B. Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated an most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See AAG82001-082706 for STS primers. (Updated on 25-MAR-2003 to correct PN

- useful for Nevoid basal cell carcinoma syndrome tumour suppressor gene detection of pre:disposition to basal cell carcinoma(s).

Claim 3; Page 79; 148pp; English.

This primer is used to the row ampitituation to axoun a nevotate basal cell carcinoma syndrome (NBCCS) (PTC) protein encoding CDMA. The basal cell carcinoma syndrome (NBCCS) (PTC) protein encoding CDMA. The NBCCS nucleic acid consistency of a 6568 (full-length sequence), compared to a second nucleic acid consistency of a 23 (AAVIS999) base pair sequence, in the presence of a human genomic library. The PTC polypeptide sequence in the presence of a human genomic library. The PTC polypeptide compared to a polypeptide encoded by the above three sequences. The NBCCS gene and its protein product, is a tumour suppressor, and is a composition to particular abnormal sequences, by thybridisation assays is useful for detecting a practiscostion to NBCCS or to a basal cell carcinoma (also known as Gorlin syndrome). Alternatively, detection is of the polypeptide and is carried out by immunosasay. Vectors comprising this nucleic acid can be used to treat NBCCS. The PTC polypeptide can mitigate symptoms of NBCCS in an organism. The NBCCS nucleic acid can be used to treat NBCCS. The PTC polypeptide can mitigate symptoms of NBCCS in an organism. The NBCCS nucleic acid can be useful from exact to matations, chosen from Exon-12 1711insC. Exon-12 1711insC, Exon-12 28640elBpb, Exon-16 2707delC, and Intron-17 3157-2A to G. The mutation may companish the mutation may be a nonsense or frameshiff mutation. Frameshiff mutation are chosen of from 244delCt, 27insA, 464insAC, 633insC, 8646187, 877delG, 929delC, 2183delTC, 22ioinsAA, 2392delA, 2593delA, 2583delBa, 2594delA, 2593delC, 2596complex, 771linsC, 2596co This primer is used for the PCR amplification of exon 21 of a nevoid
